Follow us on: The latest versions of Windows come with an integrated and modern PDF reader that delivers a basic toolset for viewing and manipulating such files. However, if you are still not into the modern, fullscreen interface of Windows 8 and up apps, you might want to give ByteShift Reveal a try. A windowed alternative to the native PDF reader of Windows 8 and later This particular application is nothing more than an alternative to the native PDF reader in Windows 8 and up, enabling you to open, view, print and manage the content of your documents. Aside from the windowed interface and more accessible ribbon-based toolbar, there is nothing more that differentiates the two. In other words, their functionality is essentially the same. Read, print, and search PDF documents With a plain look and options that are one-click away, ByteShift Reveal enables you to open, view and print PDF documents, providing navigation options to scroll through multi-page files, as well as simple selection tools. Unfortunately, it does not allow you to open more than one document at a time. You can, however, open multiple instances of the application and view a distinct document in each. You can use ByteShift Reveal to rotate the pages of the opened document and zoom in the content, either with the mouse wheel or using the dedicated toolbar buttons. The 'Find' option enables you to search the document content for a specific keyword. Opened documents can be easily shared with others via some of the most popular social networks. A good PDF reader that needs improvements to gain popularity ByteShift Reveal is not by far as powerful as its direct competitors. While it does its job well, there are additional features that would make it more sought after among users. For instance, being able to export the PDF document to other formats would be a real plus. Not to mention more advanced search options or basic editing, commenting or signing capabilities, which would bring it closer to the competition. ByteShift Reveal Description: *

In the other column I have a button. Once the button is clicked it should add an input in the first column. I am able to do this. The problem is that the input is created inside the column as added but in its own Dom-Node. So now the Modal is next to the first column instead of the second column. I already tried moving the modal around but i never managed to make it. My current component for the modal looks like this (ignore the other stuff i'll add that does not seem to be related to the question): b7e8fdf5c8
