⬜ Works on Windows, Mac and Linux. ⬜ "FixSrtLines" is a great solution for any case where the title of the srt file starts with a numbers (the.srt file has been encoded with the SubRip 2.0 method) and the 2nd subtitle of the srt file starts with the same number as the title "FixSrtLines" will fix that number and convert the srt file to an srt file with the subtitle title correct and working. "FixSrtLines" works on every *.srt (without timecode) and on every *.smi (without timecode) too. If the.srt/sami file has a timecode, you must make sure that the timecode is 00-01-00, otherwise "FixSrtLines" will not work. "FixSrtLines" does not work on *.mp3, only *.mp4 (or any other audio format) is supported by "FixSrtLines". Another nice feature of "FixSrtLines" is that it will work on older subtitle (.srt files). Features: - When the first subtitle of the srt file has a timecode like 00:00-00:01. It will remove the timecode from the title of the subtitle. - When the title of the second subtitle starts with a number, it will fix the number. - When there is a subtitle that has more time than the others, it will split the subtitle into two, and when the first subtitle is only 2 letters long, it will put the first subtitle at the end of the new subtitle. - For subtitles of more than 2 lines, it will find the time to get to the second line, and will make the subtitles 3 lines. - When a subtitle starts with another subtitle, it will find that time. - The subtitle with the most letters will be put at the start of the new subtitles, or at the end, if it will be too long (but it must be longer than the minimum time) - Use --overlapped as a option to put the text of the first subtitle at the end of the new subtitle. - You can select what character will be used to put the subtitles (like a, i, u, etc) - With the --credits option, you can put your text in the credits of the srt files
