This tool is meant to be used to create a simple application where you can share files and share data. To view the contents of a file in QtData Server, the application should have been told where to find the file in order to render it, so the program needs to have information about where the file was stored. When rendering a file, QtData Server will use the Qt library for this. QtData Server: QtData Server allow you to manage several files. Each file is represented as a data source. If a file is created outside the application and the file is already in your data directory, you can add this file as a data source directly from the application. When the file is modified or copied, the data will be monitored. When the data changes in a file, the data is synchronized, thus changing the data in the various data sources that have been configured to monitor that file. You can set up a data server for all the files that you wish to share, and your data will be mirrored, meaning that they will be synchronized from each computer where your data server is installed. To add a file to the data server, you have to specify its name. It is possible to add files in the data folder from the code. QtData Server keeps a status of the data source so you know if a file is being modified. QtData Server: QtData Server can be used to share multiple data files.
