Download.Mycobacterium tuberculosis in HIV sero-discordant couples in New Delhi, India. The prevalence and incidence of Mycobacterium tuberculosis in HIV sero-discordant heterosexual couples in New Delhi, India, were determined over a 2-year period. HIV-infected patients were treated with zidovudine and lamivudine for 2 years and followed up for 1 year after initiation of therapy. Of 81 TB-HIV sero-discordant couples followed up, the prevalence of TB was 6.1% in the HIV-seropositive partners and 2.4% in the HIV-seronegative partners. The incidence of TB was 6.0 per 100 person-years in the HIV-seropositive partners and 1.8 per 100 person-years in the HIV-seronegative partners. None of the 37 treated couples were confirmed cured. These data suggest the incidence of TB in HIV-sero-discordant couples is similar to that in the general population and that incidence is high in HIV-infected partners in whom CD4 counts are If the gap between rich and poor is growing at even a slightly slower rate than the rate of increase in income over the past 50 years, it suggests that something is going wrong. If the gap is growing faster than that, it suggests that something is going right. The point is that you are trying to understand something that's already a big deal. Because, to the extent that income inequality grows 570a42141b
