The Game VR Roller Coaster by Global Wonders is a new VR experience, that allows players to enjoy to the fullest the world of amusement parks. All of this could be used in certain games. For example, you could use the most basic of the physics to simulate gravity using an inverse on the forces  $x$  and  $y$ . Or you could use it for a driving game where you use the touchpad to control how fast you move your vehicle, and use the accelerometer to control the actual amount you accelerate when the car has momentum. That way you can mess around with any of the numbers, and see how it affects the physics. Of course, you could also mess with how the player controls the car by changing the  $x$ ,  $y$ , and  $x*y$  values. The rate at which a car is accelerated when the momentum of the car has decreased is called a deceleration constant. It can be a number between 0 and 1, where 0 represents linear deceleration and 1 is maximum

---

deceleration. It is referred to as a deceleration constant because deceleration is actually how fast a car stops. So if you want to slow the car by 1 mph every 5 seconds, you'd set a deceleration value to 0.1. A deceleration of 0.05 means that the car will reduce its speed by 5 mph every 5 seconds. A deceleration of 1 means that the car will reduce its speed by 10 mph every 5 seconds. A deceleration of 0.99 means that the car will reduce its speed by 9.9 mph every 5 seconds. When the car stops, the deceleration constant is set to infinity, so it doesn't matter how fast or how slow you stop the car, it will stop.

Increase in momentum =  $x(1-r)$  Decrease in momentum =  $xr$  When you ask your engine for more power, the car will increase its momentum by  $1, r$ . When you ask your engine for less power, the car will decrease its momentum by  $1, r$ . When you ask your engine for more power, the car will increase its momentum by  $1, r$ . When you ask your engine for less power, the car will decrease its momentum by  $1, r$ . While you are driving, your momentum is inversely proportional to the deceleration constant,  $r$ . Increase in momentum =  $x(1-r)$

bruised, having been kicked about by the pet animal's paws and mouth. I toss it aside, disgusted. Wipe the gore off your hands and your pants and so on, slip away from the corpse, and arrange the rest of the scattered weapons in your way. Description of the Related Art With a stator coil winding block fastener which is used when stator coil windings are wound, first a steel annular bobbin is integrally and rotatably provided around an end portion of a stator. Thereafter, a stator coil is wound around the bobbin, and the bobbin is inserted into a slot between a plurality of teeth of a stator core. The structure and operation of a conventional stator coil winding block fastener are shown in FIGS. 9 to 12. In FIG. 9, a steel ring 1 is formed in a cylindrical shape, and is used as a stator plate. A stator core 2 is formed of a plurality of teeth 3, and the stator core 2 is rotatably supported between a pair of end plates 4. Slots 5 for receiving a bobbin are provided between the pair of end plates 4. Each tooth 3 includes an inside hook 6 and an outside hook 7. The hooks 6 and 7 have a basic shape formed by an arc. When the inside hook 6 has the basic shape of an arc, the inside hook 6 is in a first angular position at a right angle with respect to a lengthwise direction of a tooth 3.
